1. A thermometer graduated according to a linear scale reads a value  $x_0$  when in contact with boiling water, and  $x_0/3$  when in contact with ice. What is the temperature of an object in  $^{\circ}\text{C}$ , if this thermometer in the contact with the object reads  $x_0/2$  ?  
 (A) 60 (B) 40 (C) 35 (D) 25

**sol. D**

$$\Rightarrow T^{\circ}\text{C} = \frac{x_0}{6} \quad \& \quad \left(x_0 - \frac{x_0}{3}\right) = (100 - 0^{\circ}\text{C})$$

$$x_0 = \frac{300}{2}$$

$$\Rightarrow T^{\circ}\text{C} = \frac{150}{6} = 25^{\circ}\text{C}$$

2. The region between  $y = 0$  and  $y = d$  contains a magnetic field  $\vec{B} = B\hat{z}$ . A particle of mass  $m$  and charge  $q$  enters the region with a velocity  $\vec{v} = v\hat{i}$ . $$I = \frac{\text{Magnetic Moment}}{\text{Volume}}$$

$$I = \frac{20 \times 10^{-6}}{10^{-6}} = 20 \text{ N/m}^2$$

$$X = \frac{20}{60 \times 10^3} = \frac{1}{3} \times 10^{-3}$$

29. Seven capacitors, each of capacitance  $2\mu\text{F}$ , are to be connected in a configuration to obtain an effective capacitance of  $\left(\frac{6}{13}\right) \mu\text{F}$ . Which of the combinations, shown in figures below, will achieve the desired value ?

Sol. **D**

$$C_{\text{eq}} = \frac{6}{13} \mu\text{F}$$

Therefore three capacitors must be in parallel to get 6 in

$$\frac{1}{C_{\text{eq}}} = \frac{1}{3C} + \frac{1}{C} + \frac{1}{C} + \frac{1}{C} + \frac{1}{C}$$

$$C_{\text{eq}} = \frac{3C}{13} = \frac{6}{13} \mu\text{F}$$

30. In a hydrogen like atom, when an electron jumps from the M - shell to the L -shell, the wavelength of emitted radiation is  $\lambda$ . If an electron jumps from N-shell to the L-shell, the wavelength of emitted radiation will be -

(A)  $\frac{27}{20}\lambda$                       (B)  $\frac{25}{16}\lambda$                       (C)  $\frac{20}{27}\lambda$                       (D)  $\frac{16}{25}\lambda$

Sol. C

For M  $\rightarrow$  L shell

$$\frac{1}{\lambda} = K \left( \frac{1}{2^2} - \frac{1}{3^2} \right) = \frac{K \times 5}{36}$$

for N  $\rightarrow$  L

$$\frac{1}{\lambda'} = K \left( \frac{1}{2^2} - \frac{1}{4^2} \right) = \frac{K \times 3}{16}$$

$$\lambda' = \frac{20}{27} \lambda$$
